Hint

Write a function that reverses a string. The input string is given as an array of characters `s`.

You must do this by modifying the input array **in-place** with `O(1)` extra memory.

Example 1:

Input: `s = ["h","e","l","l","o"]`
Output: `["o","l","l","e","h"]`

Example 2:

Input: `s = ["H","a","n","n","a","h"]`
Output: `["h","a","n","n","a","H"]`

Constraints:

- `1 <= s.length <= 105`
- `s[i]` is a **printable ascii character**.

```
class Solution {
    public void reverseString(char[] s) {
        int left = 0, right = s.length - 1;
        while (left < right) {
            char k = s[left];
            s[left++] = s[right];
            s[right--] = k;
        }
    }
}
```

Two Pointers Algorithm

→ Set `left = 0`, `right = n - 1`.

→ Swap `s[left]` and `s[right]` until `left < right`
and `left++` and `right--` every time.

Time: $O(N)$
Space: $O(1)$
